Blockchain is an enabler.

We simply use it for a higher purpose.

Quantifiable TRUST.

It's not about the data. It's about the patient.

● Lack of medical history

● Unexploited data

● Tech skepticism

● Prevention deficiency

● Weak Cybersecurity

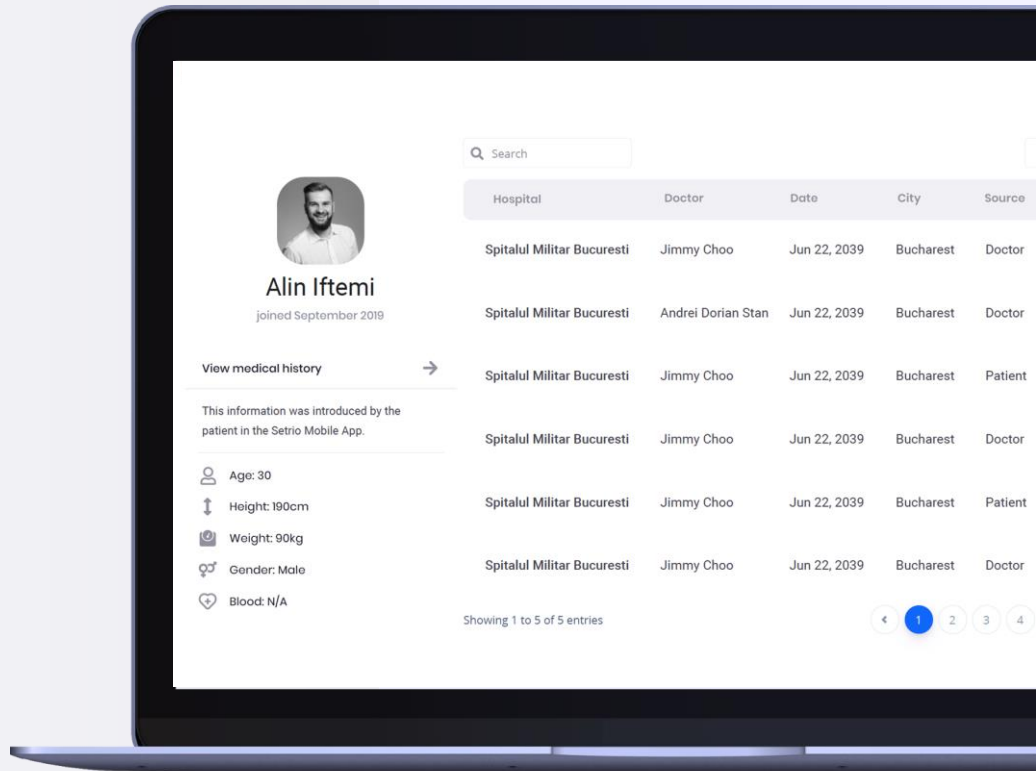

Blockchain Technology for Healthcare Records

Benefits

- > Complete Data Ownership
- > Interoperability
- > Single source of truth
- > Embedded Compliance
- > Extra layer of Security
- > Audit trails
- > Real time Data Reconciliation

Permissioned Healthcare Records

Product Overview

Data Management

- Patients can give customised permissions to their data to whomever they want authorized, for as long as they want.
- Data owners will be aware of who has access to all the records they own at all times and can monitor the actions of authorized entities in handling their data (*adding notes, downloading or uploading files*)

Medical History

- Patients get access and control their entire medical history easily, allowing them to focus on their health, instead of gathering and organizing their health information.
- Providing one easily-accessible and complete version of a patient's health record for healthcare providers to coordinate better and personalize care recommendations.

Medical Visits

- A patient can log in to the **Modex PHR** app and upload documents and notes and communicate with all of his or her physicians at once to better manage their health maintenance and appointments.
- Physicians and specialists treating the same patient can ask permission to a patient's entire care journey and can contribute as a team with the most updated information.

Product Functionalities

Real-time single source of truth

Authentication & Data Ownership

Data Sharing & Custom Permissions

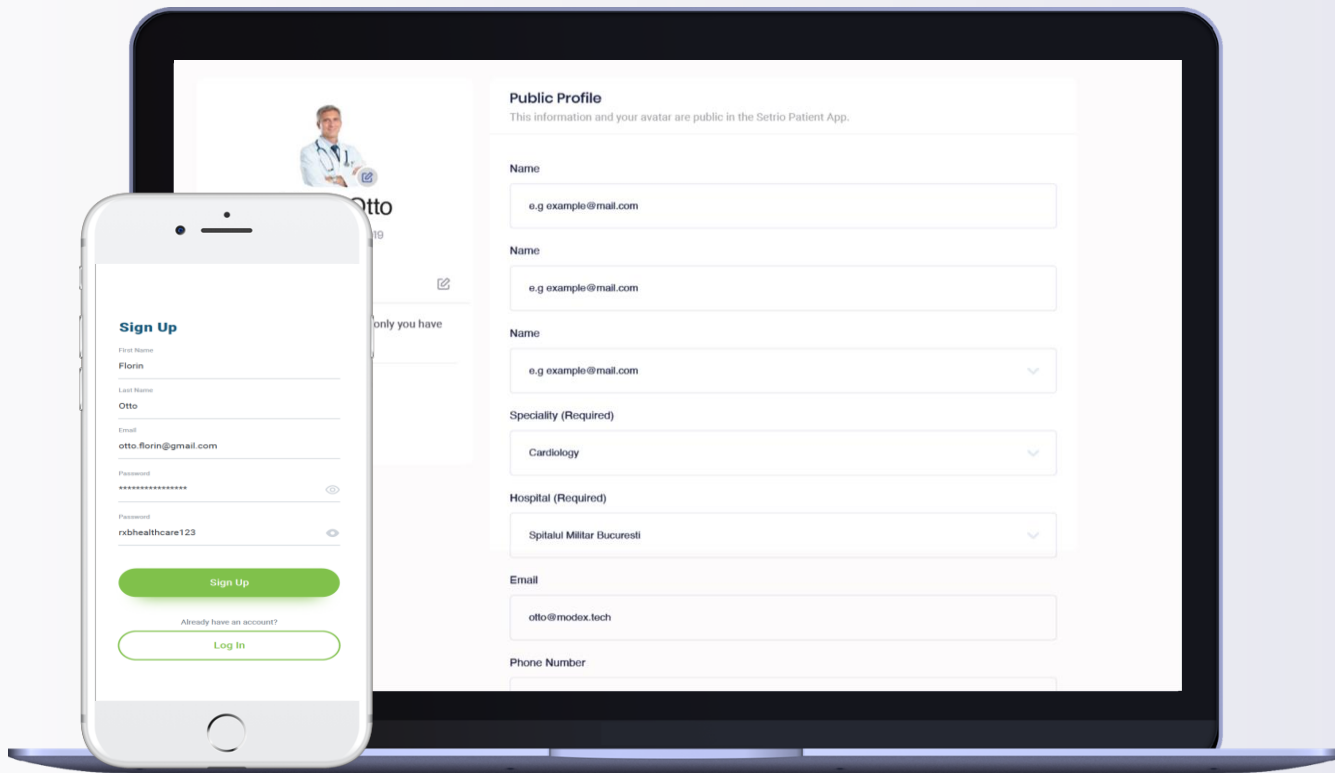

Data Encryption

Interoperability

Instant Data Recovery & Decentralization
